

Al-Taif Unified ID (TUID) App

We aim to provide a smart identity gateway which manages profiles in a secure and reliable environment that is accessible to registered entities only.

As business grows, the clients base grows with it. That brings with it a challenge of maintaining the identity archive. Our system aims to tackle this challenge.

There are many examples of successful implementation of identity gateways. We are continuing from where others had stopped.

We offer a database of stored identity profiles that can be managed by account holders. These profiles are reviewed by our back-office team. Once the profile is trusted and communication details verified, it can be share with the registered entities to allow, sign up, sign in, and profile sharing to speed access to reliable information. Any future update of the profile information will be reflected in future access to stored information.

The user retains the control over the data access and they may decide to limit access to their profile if they wish to do so.

In business, we need accurate data to make correct decisions. Al-Taif Unified ID (TUID) provides the most valuable ID gateway app in the country. We strive to make this data available to more and more subscribed parties.
